ROAD ACCIDENTS

T143 –Kushagra Singh

Why Road Safety is a major concern?

◦ According to the latest reports –India has 1% of the world vehicle whereas 11% of the total road accidents in the world happen in india.

There's One Death Every 4 Minutes Due to a Road Accident in India

Know the Accident Statistics in India ›

Major Issues

ISSUE 1-DISTRACTED DRIVING,DROWSY DRIVER,NIGHT DRIVING,MINOR DRIVING

ISSUE 2-SKIPPING SIGNALS,OVERTAKING FROM WRONG SIDE,TAILGATING
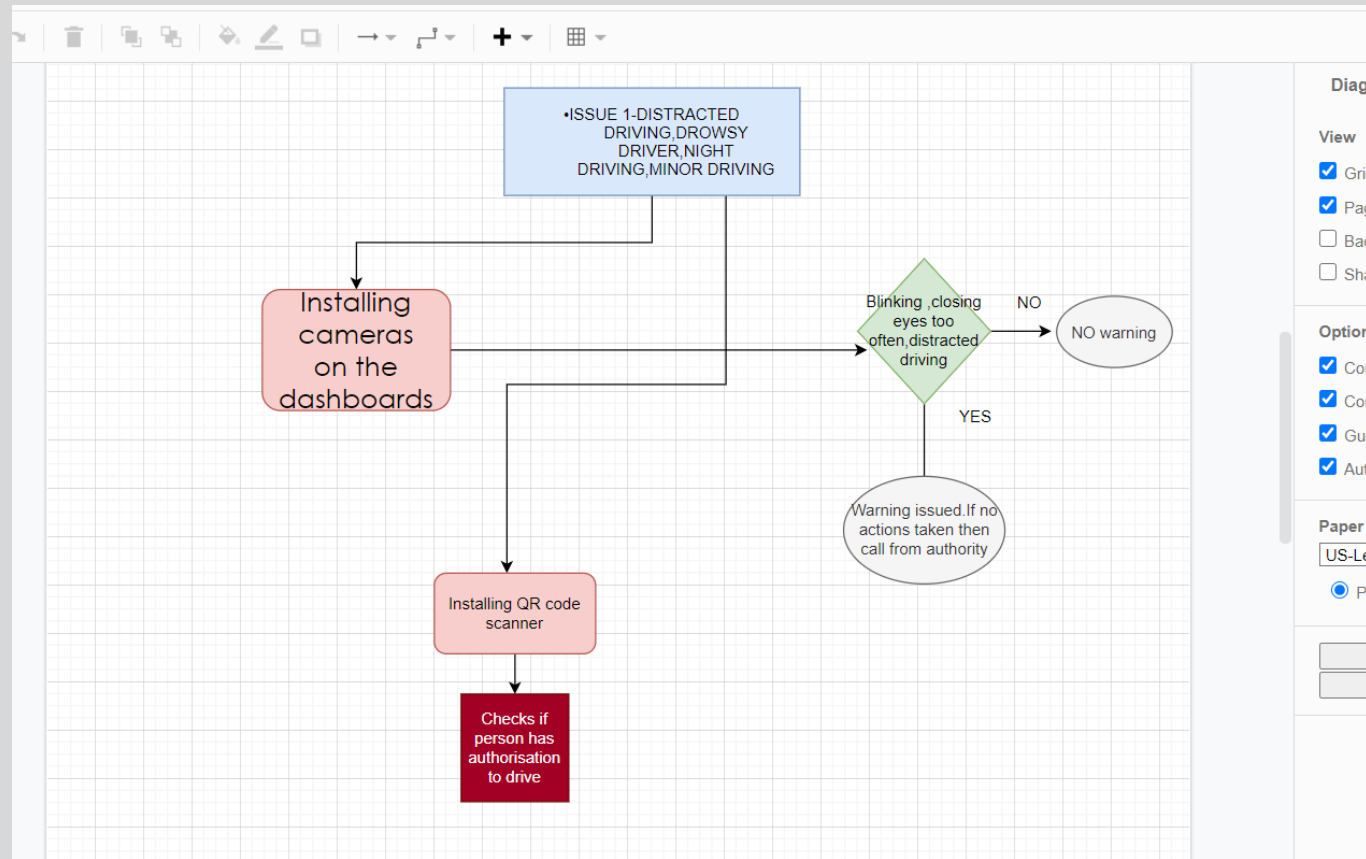

ISSUE 3-DEADLY CURVES,NOT REMAINING CAUTIOUS IN ACCIDENT PRONE ZONE,POTHOLES

Solutions for First Issue

◦ Installing cameras on the dashboards, primarily for cabs,rental services like autos,transport vehicles which tend to be excessively on roads.

◦ The cameras involving a ML based backend should identify whether the person is blinking the eyes too often,or is closing the eyes for way long while driving indicating a drowsy driver,or cases such as the driver is distracted when simultaneously using phone or eating .

◦ An alarm should be triggered inside the car asking to pull the car over and freshen up or stop using devices while driving.If the driver fails to fulfill the condition a message should pop up with the drvier contacts at the road safety terminals and then either the driver is called and instructed to stop the car or a penalty is imposed.

◦ Above the webcam there should be a scanner of QR code which should be embedded in the driving licence.The ought to scan the QR code prior to commencing the ride.This would drastically reduce chances of minors driving or a person not having valid driving license driving a car.
DRAWIO REPRESENTATION

Ways to resolve the second Issue

◦ Atleast 3-4 small cameras and sensors should be put on the exterior of the car.

◦ There should be a ML based chips which should be mandatory to be installed inside the car while manufacturing and in not so proximity such that it can be easily altered by a person.

◦ The chip should initiate a waring when the car is crossing the speed limit which is set for that region or is not driving on the wrong side of the lane(all the data and stats related to speed limits should be standardized and stored in the memory).

◦ The cameras and sensors can keep a check if the driver is overtaking from the right side or not.

◦ The chip also should contain a gps tracker to help the cops track the person with the vehicles in case one is involved in any kind of malpractices.

◦ If the driver is often tailgating other vehicles than the sensors can spot that.

◦ Web cabs having ML backed should be installed on the traffic lights and if any driver is skipping it then using wifi the chip installed in the cars should be triggered and the exact location and number plate is updated at the road safety teminal
DRAWIO REPRESENTATION-

Sorting out the third issue-

◦ A Artificial Intelligence based systems should be present in the car which is conneted to the chip installed or the driver has an option to use the Mobile Bluetooth .

◦ There should be a voice message to the driver of being cautious when he is entering a zone frequently prone to accidents.

◦ Driver should be informed if there is a dead end or a deadly curve ahead.

◦ When on a difficult terrain such as mountainsor steep slope,using the satellite imaging the driver should be informed if there is a car approaching from the another direction.

◦ The cameras installed on the exterior of the cars should also keep a check on the condition of the roads.If there are too many pot holes then a messase should be sent to the concerned authorities required immediate actions to improve the condition of the road.

◦ If the required department doesn't take action under stipulated time period.Then higher authorities should be informed using AI in the background at the earliest.

Other Methods to curb Road accidents

◦ A line should be made all the major junctions where the vehicles must stop when the traffic light is on red.Sensors should be attached on either side of the lane across the line so any vehicle happens to cross it then the chip installed in the car should be activated and simulataneously it should be udated in the systems of road safety terminus.

◦ All cars should have some feature of self driving cars such that in case some one has lost control of the car and is rushing in towards some other car from behind…so the car in front should be able to sense this and take actions within fraction of seconds.

◦ To conclude there must be transparency in the government bodies regarding various actions taken as well as being a law abiding and resposnsible citizens it is our duty to look out for the safety of not only our loved ones but of all the people traveling on roads.
